Letter from the President

The University of Göttingen is committed to the education of the next-generation scientists. Firmly rooted in excellent science, our goals are to train competent and critical young academics that are able to meet the challenges of the future. Within the Göttingen Campus, the cooperation between our university, the local Max-Planck Institutes and the German Primate Center fosters a dynamic and vibrant research environment in which the free exchange of ideas leads to top science in a true manifestation of the famous “Göttingen Spirit”.

The two international MSc/PhD programs in Molecular Biology and Neurosciences are highly acclaimed role models in graduate training that almost 20 years after their foundation continue to be enormously successful. Embedded in the Göttingen Campus they integrate faculty members across institutional borders and provide junior faculty members with full rights as thesis supervisors. The programs offer not only scientific training of outstanding quality but also a comprehensive range of services including training in professional skills, career counseling, and practical support for dealing with daily life, greatly facilitating integration of students from abroad. Due to their success, these programs served as blueprints for the creation of additional PhD training programs that are united under the roof of the Göttingen Graduate Center for Neurosciences, Biophysics and Molecular Biosciences (GGNB). The GGNB was supported by the Federal Excellence Initiative until the expiration of its Graduate School program and is now stably financed by the university in cooperation with its partners on the Göttingen Campus.

The Molecular Biology and Neuroscience programs remain unique within the GGNB in offering integrated MSc/PhD curricula with a fast track option, which allow excellent BSc graduates to directly enter the PhD phase after successfully absolving the initial 1st year training phase. For almost two decades, these international programs have been particularly successful in attracting large numbers of high quality applicants from all around the world, allowing for the selection of the very best candidates. The new concepts that were introduced by these programs have recently been adopted by the Georg-August University School of Science (GAUSS) and other graduate schools for the benefit of the entire University.

While maintaining their successful structure, the content and focus of the training curriculum of the programs has continuously been adapted to keep pace with the dynamic change of research areas in the participating institutions. Accordingly, new faculty members are integrated to reflect novel developments in research. They will further ensure optimal individual supervision and up-to-date research-oriented training. Beyond academia, both programs maintain close links with the relevant industries to enhance the opportunities of the graduates for a successful professional career in the private sector.

As founding member and former speaker of the international MSc/PhD program in Molecular Biology I am very proud of what we all have achieved, and I remain on board as an active faculty member despite the many obligations in my new office. Most importantly, I would like to thank all colleagues and institutions for their unwavering commitment to these international programs and, last but not least, the German Academic Exchange Service (DAAD), the Lower Saxony Ministry of Science and Culture, and the various generous donors. The University of Göttingen will continue to support these programs to promote international exchange at all levels and for further interaction with our partners worldwide.

Prof. Dr. Reinhard Jahn

(President of the University of Göttingen)

Letter from the Max Planck Society

The mission of the Max Planck Society is to conduct top-level basic research in science and the humanities. Because this is only possible with bright young minds, the Max Planck Society funds graduate education nationwide - including the International Max Planck Research School for Molecular Biology in Göttingen.

Currently, over 80 Max Planck Institutes are located on scientific campuses across Germany, most of them close to universities. To strengthen the scientific ties with universities, the Max Planck Society, together with the German University Rectors' Conference, launched the International Max Planck Research Schools (IMPRSs) as a new joint program - during celebrations in Göttingen on the occasion of the 50th anniversary of the Max Planck Society.

The goals of the International Max Planck Research Schools are

- to attract excellent students from all around the world to intensive PhD training programs in Germany, preparing them for careers in science,
- to integrate internationally renowned Max Planck researchers into top-level scientific training programs for junior scientists, and
- to strengthen international relationships by providing individual support to each student and by exposing foreign students to German culture and the German language.

By now, 66 International Max Planck Research Schools have been established involving 83 Max Planck Institutes, 36 German universities, and 26 universities abroad. Over 3,200 PhD students from 123 countries are presently enrolled.

Since their foundation in 2000, the Göttingen IMPRSs in Molecular Biology and Neurosciences have met with particular - and extraordinary - success. This is due to multiple factors. Most notably, both programs are the result of a true synergism between the local Max Planck Institutes, the University of Göttingen, the University Medical Center and the German Primate Center, which allowed to completely reform local graduate education in the course of their establishment. Moreover, all of the respective IMPRS funds are invested into excellent training conditions, comprehensive services and financial support of the students, which is a major attraction for the best students worldwide. Accordingly, most former students of our programs moved on to prestigious international institutions and continued their successful careers.

Over the past two decades, the IMPRS-funded graduate programs in Molecular Biology and Neurosciences have received unanimous acclaim during external evaluations and won national awards. For instance, they are the only Life Science Programs within Germany that were selected for the „Top Ten International Master's Degree Courses 2006". The schools have also re-shaped the local scientific community, strengthening the ties between the participating institutions, and initiated new scientific collaborations that augment the international reputation of Göttingen as a center of scientific excellence. Furthermore, the schools served as role models and founding members of the Göttingen Graduate Center for Neurosciences, Biophysics, and Molecular Biosciences, thus being instrumental for the continued support by the German Excellence Initiative provided to the University. We hope that in the years to come our IMPRS students will continue to be successful in their professional careers - and that they will remember their training period in Göttingen as an exciting, stimulating, and formative phase of their lives.

Marina Rodnina
Spokesperson of the IMPRS
for Molecular Biology

Overview

This yearbook is intended to provide information on the international MSc/PhD Molecular Biology Program in Göttingen, Germany, which was established in the year 2000 as a joint venture of the University of Göttingen and its non-university partners. It is also supported by the Max Planck Society as an International Max Planck Research School (IMPRS). In addition to general information on the program, the yearbook introduces the MSc students of the 2019/20 class, the faculty members, the program committee and the coordination team.

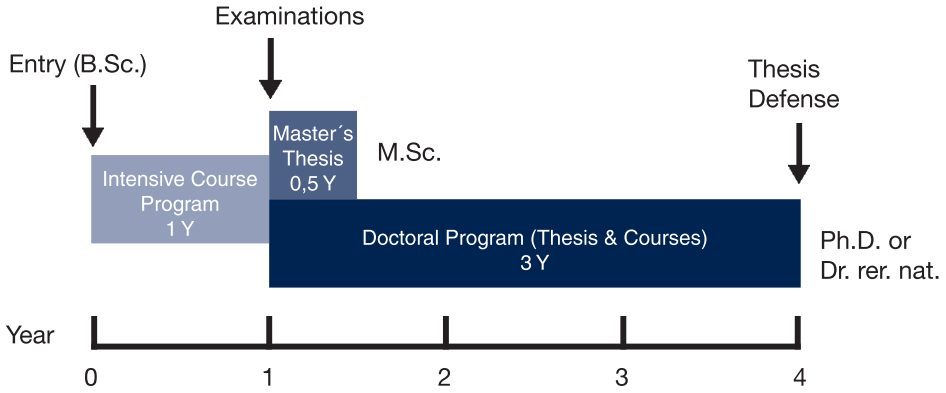
The program is a member of the Göttingen Graduate Center for Neurosciences, Biophysics, and Molecular Biosciences (GGNB), which was supported by the Excellence Initiative of the German Federal and State Governments until the expiration of its funding line for graduate schools. The GGNB is now stably financed by the University in cooperation with its partners on te Göttingen Campus. It is offered by the Göttingen Center for Molecular Biosciences (GZMB), the Max Planck Institute for Biophysical Chemistry, the Max Planck Institute for Experimental Medicine, and the Leibniz Institute of Primate Research (German Primate Center). Further to their active participation in the Molecular Biology Program and the research activities of the GZMB, the above-mentioned partners closely cooperate in several research alliances, collaborative research centers, and interdisciplinary doctoral programs.

The intensive, research-oriented curriculum of the International MSc/PhD Molecular Biology Program qualifies students for professional work in the fields of molecular and cellular biosciences. The program is open to students from Germany and from abroad, who hold a Bachelor‘s degree (or equivalent) in the biosciences, chemistry, medicine, or related fields. Scholarships are available. All courses are held in English. The academic year starts in October and is preceded by a three-week orientation program. Applications may be submitted until January 15 of the year of enrollment. To ensure a high standard of individual training, the number of participants is limited to 20 students per year.

All students initially participate in one year of intensive course work. This first segment of the program comprises lectures, tutorials, seminars, methods courses, training in professional skills, and individually supervised research projects (laboratory rotations). The traditional German structure of academic semesters is not followed. The condensed schedule allows students to accumulate 90 credits (ECTS) within one year, which would normally require three semesters.

Subsequently, two separate segments are offered:

- **PhD Program:** Good to excellent results after the first year qualify for direct admission to a three-year doctoral project in one of the participating research groups. The Master’s thesis requirement is waived in this case. After successful defense of a doctoral thesis, the degree Doctor of Philosophy (Ph.D.) orthe equivalent title *Doctor rerum naturalium* (Dr. rer. nat.) is conferred.
- **MSc Program:** Alternatively, students may conclude the program with a Master’s thesis, based on six months of experimental scientific research. The degree Master of Science (MSc) is awarded upon successful completion of the Master’s thesis. The continuation in the PhD Program is possible and desired.



Intensive Course Program (First Year)

Throughout the first year, current topics in molecular biology are covered by

- lectures
- tutorials
- methods courses
- laboratory rotations
- seminars

Lectures and Tutorials

A comprehensive lecture series is offered in a sequence of 6-12 week units. The following topics are taught at an advanced level throughout the first year (36 weeks, 4 hours per week):

Module M.MolBio.11: DNA and Gene Expression

- Fundamental of biophysical chemistry
- Architecture of the cell
- DNA and chromatin structure, epigenetics, genomics
- DNA replication and repair
- Transcription, RNA splicing, RNA quality control
- RNA-based regulation of prokaryotes and eukaryotes
- Translation, protein structures and folding, posttranslational modification

Module M.MolBio.12: Metabolic and Genetic Networks

- Enzyme mechanisms and regulation
- Basic metabolism, metabolic networks
- Biological membranes
- Photosynthesis
- Signal transduction
- Microbiomes

Module M.MolBio.13: Cell Biology / Immunology / Neuroscience / Developmental Biology

- Biosynthesis of organelles, nucleocytoplasmic transport
- Protein sorting and processing, membrane traffic
- Ubiquitin, autophagocytosis
- Cytoskeleton, cell adhesion
- Immunology, infectious diseases, principles of pathogenicity
- Cell cycle, meiosis, apoptosis, cancer
- Neurons, synapses, synaptic transmission
- Glial cells and brain vasculature
- Nervous system, sensory systems
- Developmental biology

Module M.MolBio.14: Model Systems / Biotechnology

- Stem cells
- Fungi, *Arabidopsis, Drosophila*
- Regeneration, organoids, oocyte development, mouse
- Primate, non-human primate models, use in virus research
- Biotechnology (bacteria, fungi, plants, insects)

Each lecture is accompanied by a tutorial session, where students meet with a tutorial in small groups. Tutorials involve exercises, review of lecture material, and a discussion of related topics.

Methods Courses

During the first two months of the Molecular Biology Program, students participate in a series of methods courses to introduce them to principles and practical aspects of basic scientific techniques and the handling of model organisms. During the first two weeks, two 4-day projects with proteins and nucleic acids introduce various basic and advanced techniques. Weeks 3 and 4 provide an overview over various aspects of bioinformatics. Weeks 5 to 7 comprise six 2-day experiments on a variety of different methods indicated below. In addition, students are offered a choice of two (out of four) 5-day special courses with an integrated concept of lectures and hands-on experiments as indicated below. Prior to the course program, students get introduced to programming in R and basis statistics.

Introductory 4-day methods courses (week 1-2)

- Proteins
- DNA

Bioinformatics courses (week 3-4)

- Programming in R, basic statistics
- Next generation sequencing, NGS analysis with R
- Protein bioinformatics
- Comparative sequence analysis, phylogeny
- Gene ontologies & biological networks

Introductory 2-day methods courses (week 5-7)

- Protein-nucleic acid interaction
- RNA analysis
- Light microscopy
- Analysis of cellular compartments
- Cell culture
- Expression analysis

Special 5-day methods courses (week 7-8)

- X-ray crystallography
- (3-D-cryo) electron microscopy
- NMR spectroscopy
- Mass spectrometry / proteomics

Professional Skills in Science

Additional training is offered in four separate units to prepare the students for professional scientific communication and good scientific practice:

- Scientific writing and graphics
- Oral presentation of scientific results
- Laboratory safety
- Good scientific practice
- Experimental animal handling

Laboratory Rotations

Starting in January, every student conducts three independent research projects (laboratory rotations) in the participating departments. Each project is individually supervised. It involves seven weeks of experimental work, followed by one week for data analysis and presentation. For each project, a report must be completed in the format of a scientific publication. The laboratory rotations cover three different research areas and methods.

Seminars

Seminars start in March. The class meets weekly for two hours to discuss student presentations. The presentations are research reports based on work from the laboratory rotations.

Examinations

After the first year of intensive training, all students take one written and two oral Master's examinations. The Master's examinations explore the students' theoretical background in topics covered by lectures and tutorials. Each oral examination investigates the qualification in selected topics of the molecular life sciences.

PhD Program

Students who have passed the Master's examinations with good or excellent results qualify for direct admission to a three-year doctoral project in one of the participating research groups without being required to complete a Master's thesis first.

The PhD program emphasizes independent research by the students in the group of a faculty member. The PhD students select three independent faculty members as their thesis advisory committee who closely monitor progress and advise the students in their research project. Laboratory work is accompanied by seminars and lecture series, a wide variety of advanced methods courses, training in scientific writing and oral presentation skills, courses in intercultural communication, career planing, time and project management, bioethics and research ethics, elective courses, and participation in international conferences or workshops. Regular industry excursions are offered to biotechnologyical or pharmaceutical companies, including visits of the R&D facilities and discussions of career options with representatives of the HR departments.

Doctoral students of the program organize the international PhD student symposium "Horizons in Molecular Biology" every year with great success, attracting outstanding speakers and up to 300 participants from all over the world. The meeting was designed by the students to promote scientific exchange between young researchers from different disciplines. Since 2007, a "Career Fair for Scientists" precedes the annual Horizons meetings. The career fair offers a unique and exciting program of career presentations, CV-Check, workshops and interviews and is also organized by the Molecular Biology students. Both events include an increasing number of alumni, sharing their experience.

At the end of the PhD training program, a doctoral thesis is submitted either in the traditional format, or as a collection of scientific publications in internationally recognized journals along with a general introduction and a discussion of the results. The degree of a "Ph.D." or, alternatively, "Dr. rer. nat." is awarded after the successful defense of the doctoral thesis.

Master's Program

After the first year of intensive training, students may conclude the Master's part of the program with a six-month thesis project, leading to a Master of Science degree. The thesis project involves experimental work under the supervision of faculty member of the Molecular Biology Program. Students also have the opportunity to conduct their Master's thesis project at a research institution abroad.

Orientation, Language Courses, Social Activities

A two-week orientation prior to the course program provides assistance and advice for managing day-to-day life in Germany, including arrangements for bank account, health insurance, residence permit, housing, and enrolment. Students have the opportunity to meet faculty members and visit laboratories of the participating institutions. In addition, the orientation program informs students about computing and library facilities, the city and university of Göttingen, sports facilities, and cultural events.

The orientation program also includes several course units to refresh basic knowledge in chemistry and physics and introduces the students to programming in R and basic statistics.

An intensive basic language course in German is offered in cooperation with *Lektorat Deutsch als Fremdsprache* to facilitate the first weeks in Göttingen. Additional language courses and social activities accompany the program.

Application, Selection, and Admission 2019

Applicants must hold a Bachelor's degree or equivalent in biology, biochemistry, chemistry, medicine, or related fields. Applicants who are not native speakers of English should demonstrate adequate competence of the English language by acceptable results in an internationally recognized test.

In the year 2019, the Molecular Biology Program received 712 applications from 67 countries.

Continent	Applications	Admissions
Europe (total)	**127**	**14**
Germany	26	6
other West Europe	24	1
East Europe	77	7

2019: Internship at the department of Materials Science, Johns Hopkins University, Baltimore (USA)

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

Germany

Annabel Maisl

EDUCATION

College / University

Julius-Maximilians-University of Würzburg

Highest Degree

Bachelor of Science

Major Subjects

Biomedicine

Lab Experience

PCR, qPCR, primer design, whole mount in situ hybridization (WMISH), design of WMISH RNA-probes, RNAi, confocal microscopy, light microscopy, ligation, cloning, agarose gel electrophoresis, helminth cell culture.

Projects / Research

04/2019 – 08/2019: “Molecular and cellular analysis of differentiation factors in the fox tapeworm *Echinococcus multilocularis*”, Bachelor thesis, Prof. K. Brehm, Institute of Hygiene and Microbiology, Würzburg

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2016 – 2020: German Academic Scholarship Foundation

Portugal

Carolina Monteiro

EDUCATION

College / University

University of Aberdeen, Scotland

Highest Degree

Bachelor of Science

Major Subjects

Molecular Biology, Genetics

Lab Experience

Yeast two-hybrid assay; DNA cloning; PCR; ELISA; SDS-PAGE; affinity column chromatography; basics of fluorescence and live cell microscopy; understanding of FISH and smFISH; mammalian cell culture; animal dissection.

Projects / Research

01/2019 – 03/2019: "Characterization of components of the spliced leader trans-splicing machinery in *C. elegans*", Institute of Medical Sciences, University of Aberdeen

06/2018: "The importance of acetate transport in bacteria for heterologous protein production", Center of Molecular and Environmental Biology (CBMA), University of Minho

07/2017: "Investigating a possible role for Zeb2 NAT on Zeb2 transcription", Institute of Molecular Medicine, University of Lisbon

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2019: Molecular Biology Prize of the University of Aberdeen

Ukraine

Denis Oliinyk

EDUCATION

College / University

Taras Shevchenko National University of Kyiv

Highest Degree

Bachelor of Science

Major Subjects

Biotechnology

Lab Experience

Molecular cloning; protein expression; all types of liquid chromatography, CD spectroscopy, melting point assay, various techniques of protein crystallization; SDS-PAGE, Western blotting; PCR, two photon polarization microscopy; fluorescent microscopy; flow cytometry; mammalian cell culture; Python, R (including a ggplot2 library); PyMOL; FlowJo.

Projects / Research

06/2019 – 09/2019: Vienna Biocenter Summer Internship, Vienna, Austria

07/2018 – 08/2018: Summer School in Molecular Biophysics, Nove Grady, Czech Republic

06/2017 – 08/2017: Amgen Scholars Internship program, Karolinska Institutet. Stockholm, Sweden

09/2016 – 06/2019: Bachelor's Thesis. Kiev National University, Kiev, Ukraine

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2019: Austrian Academy of Science Research Scholarship

2017: Amgen Foundation Research Stipend

2015 – 2019: Ukrainian State Scholarship for students with excellent studying achievements

Argentina

Nadia Paglilla

EDUCATION

College / University

Faculty of Pharmacy and Biochemistry, University of Buenos Aires (UBA)

Highest Degree

Biochemist

Major Subjects

Biochemistry, Immunology, Clinical Laboratory Science

Lab Experience

Cell culture, isolation of cell subpopulations from peripheral blood (density gradients and column-based magnetic systems), flow cytometry, cytotoxicity assays, viability assays, ELISA, Western blotting, zymography, differential centrifugation, bright-field and fluorescence microscopy, routine techniques in clinical bacteriology and clinical chemistry.

Projects / Research

2018 – 2019: “Autophagy as a modulator of pancreatic tumours immunogenicity. Effect of exosomes released from pancreatic tumour cells on immune cells.” Immunology department, Faculty of Pharmacy and Biochemistry, UBA

2017 – 2018: “Effects of targeting hyaluronan metabolism in classic Hodgkin Lymphoma.” Immunology department, Faculty of Pharmacy and Biochemistry, UBA

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2018 – 2019: Argentinian National Cancer Institute scholarship for students

2017 – 2018: University of Buenos Aires undergraduate research scholarship

India

Atmika Paul

EDUCATION

College / University

Indian Institute of Technology, Madras

Highest Degree

MS (by Research) in Biological Sciences

Major Subjects

Cancer Biology, Advanced Cellular and Molecular Biology, Human Genetics

Lab Experience

Laboratory animal handling (RCULA); CRISPR-Cas9 mediated gene editing; confocal microscopy; live cell imaging; IHC, immunoblotting; qRT-PCR, flow cytometry and sorting; advanced cell culture techniques and functional assays; lentiviral transduction; protein-protein interaction techniques; molecular cloning; Baculoviral expression system.

Projects / Research

2015 – 2018 “Functional characterization of RAS effector, RASSF7”, IIT Madras, India

2016 – 2018 “Role of 14-3-3σ in progression of OSCC”, IIT Madras, India

2014 – 2015 “Role of Monoamine oxidase A in ageing”, NIT Durgapur, India

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

01/2019 – 07/2019: NUS, Singapore research fellowship

2018: Awarded travel grant for poster presentation at Keystone symposia by IIT Madras

2015 – 2018: GATE scholarship in Biological Sciences (All India Rank 58)

2015: Awarded DBT: Category I scholarship (Ranked Top 275 in India)

2014: Awarded Indian Academy of Sciences Summer Research Fellowship

Brazil/Germany

Ana Carolina Schwarzer

EDUCATION

College / University

Federal University of Paraná

Highest Degree

Bachelor of Science and Licentiate

Major Subjects

Molecular and Cellular Biology, Biochemistry, Genetics, Biotechnology

Lab Experience

Molecular cloning; DNA extraction; mammalian cell culture (2D/3D); recombinant protein expression (*E. coli*/mammalian cells); protein chromatography; electrophoresis; Western blot; protein crystallization assays; flow cytometry.

Projects / Research

04/2019 – 08/2019: "Validation of an in-house model of *in vitro* Reconstructed human Epidermis (RhE) for evaluation of cutaneous irritation by OECD method 439" (ALS Global, São Paulo, Brazil)

03/2018 – 02/2019: "Expression, purification and crystallization of Utp24 protein of *Trypanosoma brucei* and *in vitro* transcription of pre-rRNA fragments of *T. brucei*" (ICC - Fiocruz, Curitiba, Brazil)

03/2015 – 12/2017: "Expression, purification and functional characterization of the Wnt signaling modulator SFRP2" (ICC - Fiocruz/PR, Curitiba, Brazil)

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2019: Technical Training Fellowship-Level 3, FAPESP Innovative Research in Small Business Program (PIPE)

2013 – 2019: Institutional Scientific Initiation Scholarship Program (CNPq)

Turkey

Damla Temel

EDUCATION

College / University

Middle East Technical University

Highest Degree

Bachelor of Science

Major Subjects

Molecular Biology and Genetics

Lab Experience

Molecular cloning techniques, mammalian cell culture and transfection, FRET, confocal microscopy, Sanger sequencing, molecular modeling methods.

Projects / Research

2018 – 2019: "Targeting linked fluorescent proteins (EGFP and mCherry) to various organelles using signal peptides to compare FRET efficiencies.", Department of Molecular Biology and Genetics, METU

06/2018 – 08/2018: "Clustering of Olfactory Receptors based on docking positions of ligands", Laboratory of Computational Medicine, Universitat Autònoma de Barcelona

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School.

2018 – 2019: ADIMODTÜ Undergraduate Research Project Grant

2018: ERASMUS + Traineeship Grant

Brazil

Chairini Cássia Thomé

EDUCATION

College / University

Federal University of Rio Grande do Sul (UFRGS) & Eberhard Karls Universität Tübingen

Highest Degree

Master of Science

Major Subjects

Biochemistry

Lab Experience

Mammalian and bacterial cell culture, *in vitro* pharmacological screening, FACS, Western blot, PCR, analysis of gene-expression data, protein quantification, cell viability, glutamate uptake, and virus titration assays.

Projects / Research

03/2017 – 02/2019: “Evaluation of the prognostic potential of metabotropic glutamate receptors in glioblastoma”, Prof. Diogo L. de Oliveira, UFRGS, Porto Alegre, Brazil

04/2016 – 07/2016: “Investigation of the antiviral capacity of MEK-Inhibitors against Influenza A Virus”, Prof. Oliver Planz, Eberhard Karls Universität Tübingen, Germany

08/2011 – 06/2015: “Comparison of glutamatergic system parameters between early and late cultures of C6 cells” and “Evaluation of antitumoral effect of imidazolium ionic liquids in glioblastoma cell lineages”, Prof. Diogo L. de Oliveira, UFRGS, Porto Alegre, Brazil

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2017 – 2019: Graduate Scholarship, CNPq, UFRGS, Brazil

2015 – 2016: Science without Borders Scholarship, CAPES, Brazil

2011 – 2015: Undergraduate Research Scholarship, CNPq, UFRGS, Brazil

Germany

Marcel Stefan Waclawczyk

EDUCATION

College / University

Heinrich-Heine-University Düsseldorf

Highest Degree

Bachelor of Science

Major Subjects

Molecular biology

Lab Experience

PCR, SDM, gel electrophoresis, cell culture, DNA and RNA isolation, western blot, enzyme interaction assays, NADPH-Assay, ICC, IHC, fluorescence microscopy, bacterial culture, expression and purification of proteins, northern blot, qRT-PCR, work with *Drosophila melanogaster*, DNA and cloning methods, enzyme assays.

Projects / Research

04/2019 – 08/2019: “Analysis of the redox regulation of Cofilin-1”, supervisor Eva-Maria Hanschmann, Department of Neurology, Düsseldorf, Germany

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

India

Akanksha Yadav

EDUCATION

College / University

Indian Institute of Technology, Bombay

Highest Degree

Bachelor of Science (BS)

Major Subjects

Chemistry, Biochemistry

Lab Experience

Wet lab - UV/Visible and IR spectroscopy; CD Titration; CD Melting; Gel electrophoresis.

Dry lab - Use of PyMol; Chimera and Coot; chemical modelling and molecular docking; molecular dynamics simulation; homology modeling; data analysis using clustering methods; hypothesis testing; unsupervised and supervised learning in R.

Projects / Research

05/2016 – 05/2019: “Molecular modelling and dynamics studies of small molecule ligands binding to G-quadruplex and i-motif nucleic acids”, Prof. Pradeepkumar P.I., IIT Bombay

05/2018 – 07/2018 “GUI development for a data-based chemical modelling software suite, CANDIY”, Prof. Gaurav Chopra, Purdue University

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2018: Summer stipend under Purdue Undergraduate Research Experience (PURE) program

2015 – 2019: INSPIRE Scholarship by the Department of Science and Technology, Government of India

2011 – 2015: NTS Scholarship for qualifying the National Talent Search Examination

Philippines

Ryan Timothy Yu

EDUCATION

College / University

University of the Philippines Diliman

Highest Degree

Bachelor of Science

Major Subjects

Molecular Biology and Biotechnology

Lab Experience

Molecular Cloning and Site-directed mutagenesis, Western Blot, Flow Cytometry, Protein expression and purification, Avidity-based Extracellular Interaction Screening (AVEXIS), Cell Culture, Transfection via Lipofection and PEG, Phenotypic Cancer assays, Cytoskeletal staining, Immunocytochemistry, fluorescence microscopy.

Projects / Research

09/2015 – 05/2019: “Distinct Oncogenic Properties of the Novel Non-hotspot NRAS E132K mutation”, DMBEL, University of the Philippines Diliman

09/2017 – 11/2017; 06/2018 – 05/2019: DDHP Project: “Confirmatory and Orthogonal Assays to Eliminate Artefactual Drug Bioactivities”, Disease Molecular Biology and Epigenetics Laboratory, University of the Philippines Diliman

02/2018 – 05/2018: “Resurrection of the ancestral RH5 invasion ligand provides a molecular explanation for the origin of *P. falciparum* malaria in humans“, Wright Group, Wellcome Sanger Institute, Hinxton, UK.

Scholarships / Awards

2019 – 2020: Stipend by the International Max Planck Research School

2017: Sanger Institute Prize

Sarah Adio

GZMB Research Group Leader

- PhD thesis at the Ludwig-Maximilians University of München, 2003 – 2007
- Post-doctoral fellow at the National Institute for Medical Research (NIMR), London, United Kingdom, 2007 – 2008
- Post-doctoral researcher at the Max-Planck Institute for Biophysical Chemistry Göttingen, 2008 – 2017
- Research Group Leader at the Göttingen Center for Molecular Biology (GZMB) of the University of Göttingen, since 2017

Major Research Interests

Molecular machines are enzymes that generate directed motion within cells. Their action is required in virtually all vital processes. Prime examples for molecular machines are ribosomes, which read the messenger RNA in order to translate it into proteins. My research centers on the understanding of how ribosomes generate motion along the mRNA and how the internal motions of the ribosome translate into its function in protein synthesis. To this end, my group employs a multidisciplinary approach bridging state-of-the-art single-molecule fluorescence microscopy with classic molecular biology and biochemistry techniques. Our work aims to visualize the multitude of small-scale intermolecular movements on individual ribosome complexes as well as the large scale displacement of single ribosomes on the mRNA. On single molecule level, we establish methods to address fundamental questions on the mechanisms of ribosome motility:

1. How fast and processive does the ribosome transit along the mRNA
2. How does the ribosome negotiate obstacles imposed by RNA secondary structure or RNA binding proteins?
3. How is ribosome motion regulated?

Mathias Bähr

Professor of Neurology

- 1985 MD, University of Tübingen Medical School, Training in Neurology at University Hospitals in Tübingen and Düsseldorf
- DFG and Max Planck Fellow at the Max Planck Institute for Developmental Biology Tübingen and at the Department of Anatomy and Cell Biology, Washington University St.Louis
- Schilling-Foundation Professor for Clinical and Experimental Neurology, University of Tübingen
- Director at the Department of Neurology, University of Göttingen since 2001

Major Research Interests

Neuronal cell loss is not only a major feature of human neurodegenerative diseases like Parkinson's disease (PD), Alzheimer's disease (AD) or stroke, but can also be observed in neuroinflammatory conditions like Multiple Sclerosis (MS) or after traumatic lesions, e.g. of the optic nerve. We examine the cellular and molecular mechanisms of neuronal dysfunction and neuronal cell death in animal models of the respective disorders with the ultimate goal to detect new targets for a therapeutic neuroprotective intervention.
We have used for many years the retino-tectal system in rodents as our standard model to study de-and regeneration *in vitro* and *in vivo*. Our group has in detail analysed the cellular and molecular cascades that follow lesions of the optic nerve and ultimately lead to cell death of the retinal ganglion cells. To monitor the changes that occur directly after lesions we succeeded in implementing *in vivo* life-imaging of the rat and mouse optic nerve, which offers us a unique opportunity to study the complex processes that follow traumatic or inflammatory lesions of CNS fibre tracts.
In classical neurodegeneration research we have choosen PD as our topic. In this field, a multidisciplinary research team with our participation in the area C2 of the excellence cluster CNMPB examines the role of a-synuclein aggregation for dopaminergic dysfunction and cell death and characterizes other disease related proteins in order to develop new neuroprotective strategies.
In all our model systems we use AAV-mediated viral gene transfer to express different disease-or de-/regeneration associated genes as research tools and also as potential therapeutic factors to manipulate the respective molecular events *in vitro* and *in vivo*. To that end, we have e.g. developed regulatory elements that allow a controlled gene expression in complex *in vivo* models.
The final aim of our research approaches is to describe in detail the molecular pathophysiology that leads to axonal and neuronal loss and to develop new therapeutic strategies, some of which have already been translated into proof of concept studies in human patients.

- Postdoctoral fellow with Prof. Joan Ruderman, Harvard Medical School, Boston, USA, 1996 – 1999
- Dr. rer. nat., German Cancer Research Center (DKFZ), Heidelberg, 1996

Major Research Interests

A hallmark of human cancer is genome instability. A major form of genome instability is chromosomal instability (CIN), which is defined as the perpetual gain or loss of whole chromosomes leading to aneuploidy. Evolving aneuploidy results in massive changes in gene expression and drives adaptation and the aquirement of new tumor phenotypes including metastasis and therapy resistance, a process now known as tumor evolution. Since chromosome missegregation takes place during mitosis it is pivotal to identify the mitotic defects underlying CIN. In fact, our lab discovered that abnormal microtubule dynamics during mitosis acts as a major trigger for CIN in human cancer cells. Moreover, we identified several oncogenes and tumor suppressor genes including BRCA1 and p53/p73 as well as Wnt signaling as important regulators of CIN. Most recently, we surprisingly found that also defects during DNA replication, so-called replication stress, can contribute to mitotic dysfunction and CIN. These cross-talks between DNA replication and mitosis are subject of our newly established DFG-Research Unit (FOR2800), in which we collaborate with seven laboratories in Göttingen and in Germany to address this important question regarding the origin of genome instability (see: www.for2800.de). Current work in our lab focuses on the following research questions:

1. How do oncogenes and tumor suppressors (e.g. BRCA1) and other cancer-relevant signaling pathways (e.g. Wnt signaling) (de)regulate mitosis to trigger CIN?
2. What are the molecular mechanisms of mitotic chromosome missegregation in response to deregulated microtubule dynamics?
3. What are the cross-talk mechanisms between DNA replication stress and mitotic chromosome missegregation?

Major Research Interests

We are interested in the generation, characterization and genetic modification of pluripotent stem cells (ESCs and iPSCs) from different primate species including humans. We use these stem cells for basic and translational (preclinical) projects. For instance, we differentiate iPSCs into cardiomyocytes. As gene editing technologies we apply different CRISPR/Cas approaches and for gene expression reversible transposon, episomal and self-replicating RNA constructs. Based on our reproductive biology expertise, we are also aiming at the genetic modification of monkeys in order to establish human disease models. They will be used for testing of novel cell and / or gene-based therapies. Finally, we investigate germ cell development in primates.

- 2001 Dr. rer. nat, University Heidelberg
- 2001 – 2002 Postdoctoral fellow, Department Computational Molecular Biology, Max-Planck-Institute for molecular Genetics, Berlin
- 2002 – 2005 Postdoctoral fellow, Department Bioinformatics, WEHI, Melbourne, Australia
- 2005 – 2008 Group Leader, Bioinformatics & Modeling, Department Molecular Genome Analysis, DKFZ, Heidelberg
- 2008 – 2018 Professor, Statistical Bioinformatics, Department Medical Statistics, University Medical Center, Göttingen
- Since 2018 Professor, Head of Department Medical Bioinformatics, University Medical Center, Göttingen

Major Research Interests

The Department of Medical Bioinformatics is developing methods in Statistical Bioinformatics as well as Systems Medicine for biomedical research. We are collaborating in biomedical research projects and working in interdisciplinary consortia on the analysis of large heterogeneous high-throughput data-sets. There we apply mainly machine learning approaches as well as analysis and reconstruction methods for biological networks. The focus of the department is the development of methods and tools for the integrative analysis of large biomedical data-sets. These methods are implemented mostly in the statistical computing environment of R.

Major Research Interests

RNAs and ribonucleoprotein complexes (RNPs) are involved in many key cellular processes, including translation and at various levels in the regulation of gene expression. Our group is interested in studying the biogenesis, dynamics, nuclear export and functions of several different classes of RNPs in both yeast and mammalian cells. We employ genome-wide techniques such as UV crosslinking and analysis of cDNA (CRAC) as well as proteomics to discover new protein-protein and protein-RNA interactions *in vivo*. Functional analysis is then performed using methods from cell and molecular biology as well as biochemistry, allowing us to gain insights into the many roles of RNP complexes. Several projects aim to understand the biogenesis of ribosomes, a highly energy consuming process that is regulated by proto-oncogenes and tumour suppressors. In particular, we focus on elucidating the roles of key enzymatic factors such as RNA helicases and exo- and endonucleases that catalyse irreversible maturation steps and thereby drive the directionality of the pathway. Determination of the functions of such enzymes also provides the basis for understanding how this process is modulated in response to environmental and developmental cues. Furthermore, multiple genetic diseases, termed ribosomopathies, are caused by mutations in ribosome biogenesis cofactors or ribosomal proteins and the detailed characterisation of these factors enables us to reveal the molecular basis of such disorders. Interestingly, we have recently found that several RNA helicases involved in ribosome biogenesis also function in different cellular processes, indicating that they may play important roles in the cross-regulation of these pathways in RNA metabolism. Another major aspect of our work is the identification of the substrates of RNA methyltransferases. This allows us to determine the roles of the modifications they introduce in regulating the biogenesis and functions of RNAs and RNPs *in vivo*.

- Since 1996 Professor of Microbiology (since 2001 Professor of Microbiology and Genetics) in Göttingen

Major Research Interests

The major focus of the laboratory is on the control of developmental programs, protein turnover, pathogenicity and the interplay between development and primary and secondary metabolism. Our models are eukaryotic microorganisms (yeasts and filamentous fungi):
(i) We are interested how light coordinates fungal development with fungal secondary metabolism and toxin production.
(ii) Nedd8 is a ubiquitin-like protein which is involved in the control of protein turnover. We study the Nedd8-system including the COP9 signalosome using fungi as model systems.
(iii) We are interested in the molecular control (protein turnover and translation) of adhesion as initial step in infection and biofilm formation.
(iv) We study fungi as models for Parkinson (yeast), fungi as pathogens of immunocompromised patients (*A. fumigatus*) and as plant pathogens (*V. longisporum*).

- 2018 Prof. h. c. of the Russian State Academy for Biotechnology and Veterinary Medicine Moscow (Russia)

Major Research Interests

We are interested in the structural and functional analysis of mammalian genes and genomes and are investigating the cause of different important genetic traits and defects in domestic animals.
Currently we are working on the following projects:

- Leg and feet disease (digital dermatitis, interdigital hyperplasia) (cattle)
- Early embryonal death (lethal haplotypes) (cattle)
- Male infertility (cattle)
- Developmental skeletal defects (Osteogenesis imperfecta, osteodystrophy) (cattle)
- Hemophilia A and B (dog)

We are using genome wide association studies (high-throughput screening and genotyping, GWAS) and next generation sequencing (NGS) techniques for the identification of chromosomal regions that are linked to the traits or disorders. Fine mapping, positional cloning and candidate gene analysis are used for further elucidation.

Major Research Interests

Our research focuses on the molecular mechanisms of nerve cell development and synapse formation and function in the vertebrate central nervous system. To this end, we combine biochemical, morphological, mouse genetic, physiological, and behavioral methods to elucidate the molecular basis of nerve cell differentiation, synapse formation, transmitter release, and postsynaptic transmitter sensing. In selected cases, we explore the dysfunction of corresponding biological processes in neuropsychiatric diseases. Our work in the field of nerve cell development focuses on the role of SUMOylation in cell polarity formation, cell migration, and neuritogenesis, our synaptogenesis research concentrates on synaptic cell adhesion proteins and their role in synapse formation and function, and our studies on the molecular mechanisms of neurotransmitter release focus on components of the presynaptic active zone and their regulatory function in synaptic vesicle fusion.

Major Research Interests

Molecular Biology: from molecular movies to regulatory systems

Gene transcription is the first step in the expression of the genetic information and a focal point for cellular regulation. Our goal is to understand the molecular mechanisms of gene transcription and the principles of genomic regulation in eukaryotic cells. We use integrated structural biology and complementary functional studies to unravel the three-dimensional and functional architecture of large macromolecular complexes involved in transcription. We also develop functional genomics methods and computational approaches to unravel the cellular mechanisms of genomic regulation. These efforts led to a first molecular movie of transcription and provided insights into gene-regulatory cellular networks. Together, these efforts shape the emerging fields of genome biology and molecular systems biology. Our aim is to understand the functional genome as a regulatory network based on the underlying structural and molecular mechanisms.

Major Research Interests

Research foci are cultivation-independent nucleic acids-based metagenomics and metatranscriptomics of complex microbial assemblages and recovery of novel genes and gene products from environmental samples such as soil, sediments, ice, and biofilms. The metagenomic screenings comprised function-based as well as sequence-based approaches. This work has led, e.g., to the successful identification and characterization proteases, cellulases, oxido-reductases, dehydratases, lipases, and DNA polymerases from metagenomes. To gain insights into the genomes of the uncultivated microorganisms and to determine metabolic potential and key functions of microbial communities in the studied environments direct sequencing and annotation of metagenomic DNA and cDNA (mRNA), and comparative genomics are carried out. Other lines of research include whole-genome sequencing, transcriptomics and functional genomics of archaea, bacteria, and microbial communities. The majority of the analyzed organisms is of industrial importance or pathogenic. The group also develops novel bioinformatic tools for data analysis and visualization.

Major Research Interests

We are trying to understand the response of cancer cells to chemotherapy. In particular, we are analyzing the impaired replication of DNA and the damage response that results from injury to DNA. Our focus is on the signaling cascades driven by DNA damage, and on the activation of the tumor suppressor p53. Technologies include the use of large scale siRNA transfection, followed by automated fluorescence microscopy, and the analysis of DNA replication by incorporation of artificial nucleosides. As a disease model, we are investigating the response of colorectal cancer to therapy. On top of classical, DNA damaging chemotherapeutics, we are evaluating other broadly acting, yet non-genotoxic drug candidates, e. g. inhibitors of histone deacetylases and heat shock proteins. On long term, we are aiming at improving the response of tumor cells to chemotherapy by combining traditional and targeted therapeutic approaches.

- 2010 – 2018 Group leader at the Inst. of Developmental Biochemistry, Georg August University, Göttingen
- Since 2018 Group leader at the Inst. of Human Genetics, University Medical Center, Göttingen

Major Research Interests

A fundamental principle of biological systems is their capacity to reproduce, which is not found in other domains of science such as chemistry or physics. In multicellular organisms like humans, this unique activity is achieved by gametes, egg and sperm. To prepare for the development of a novel organism after fertilization, the oocyte shows a fascinating organization into various compartments.
The aim of our research is to understand the molecular mechanisms, which control the cellular organization of the oocyte. For our experiments, we take advantage of the zebrafish, which in recent years emerged as an outstanding vertebrate model to investigate molecular processes *in vivo*. We previously isolated a collection of mutations in key regulators, which show defects in the organization of the oocyte. We apply a combination of molecular genetics and cutting edge genomics such as next-generation-sequencing to identify the affected genes in these mutants. In the most interesting mutants, we started to characterize the molecular function of these essential genes. For this purpose, we incorporate biochemical methods with cell biological approaches e.g. imaging to explore the dynamics of protein localization *in vivo*. With these techniques, we discovered proteins controlling the assembly of RNA-granules as an example for a membrane-free compartment. Recently, we also analyzed membrane bound compartments and identified an important regulator of secretion. Our long-term goal is to understand the intricate molecular organization of the oocyte, which prepares it for fertilization and subsequent embryogenesis.

Major Research Interests

Spatiotemporal control of protein interactions in signaling pathways is vital in biology. The reversible activation of signaling proteins or complexes through post-translational modifications (PTMs) plays a central role in the regulation of biochemical switches in signal-transducing systems. The primary interest of our research group is in a less studied alternative process in cellular signaling, which is operational in cell division, DNA damage signaling, and autophagy. The signal transduction mechanism relies on the reversible change of a protein's three-dimensional structure to regulate its protein-protein interaction potential. The crucial paradigm emerging from our previous studies in cell division is that structural conversion of HORMA domains is catalyzed, both at the assembly and the disassembly level, by specialized protein machinery, allowing dynamic control of signaling. We are interested in the molecular mechanisms that regulate the topological changes in these signaling protein complexes, which are essential in the initiation of signaling.
Instead of studying these processes in their complex cellular environment, we aim to biochemically reconstitute these dynamic reactions from purified components *in vitro*. This allows us to study and manipulate all biochemical activities in great detail, identify the minimal set of components, and ultimately reveal the underlying fundamental principles. Typically, our projects use a bottom-up approach, where we build macromolecular machines from scratch to understand them in details using a combination of biochemical reconstitution, structural biology, and biophysical investigations

Major Research Interests

The group is currently studying different aspects of the lipid metabolism of plants, algae, mosses and fungi. In this context we are primarily interested in the metabolism of structural lipids and lipid-derived signal transduction processes. For this purpose, we make use of both classical techniques as analytical chemistry and biochemistry as well as of modern approaches in the area of molecular genetics, including the generation of transgenic organisms („gain-of-function“) or mutants („loss-of-function“).
Biochemistry and function of oxylipin metabolism:
We are interested in physiological functions of lipid peroxidation processes. Thus we analyze the function of specific lipoxygenases, i.e. the role of their products, so-called oxylipins (oxygenated fatty acid derivatives), as signals or defence substances during biotic and abiotic stress. Lipid peroxidation reactions are analysed in general by metabolomic approaches. Other studies deal with the role of oxylipins in mosses and algae. In addition the catalytic mechanism of lipoxygenases and related dioxygenases is analysed.
Biochemistry of the biosynthesis of structural lipids:
We study the biochemical pathways or networks that led to an increase in the seed oil content of oilseed crop plants and oleogenous algae. Two other projects deal with the biochemistry and function of sphingolipids in plants with wax ester forming enzymes. In addition we aim to identify chemical signals by metabolomics approaches that are exchanged during the interaction between insects and *Arabidopsis thaliana*.

Major Research Interests

In order to understand the relationship between the three-dimensional structure and the cellular function of biological macromolecules we determine the structures of proteins and protein-RNA complexes by means of X-ray crystallography. Our current projects concern proteins involved in the splicing and modification of RNA and, as well, proteins required for the nucleocytoplasmic transport.

Major Research Interests

The long-term goal of our research is to understand the cellular and molecular mechanisms underlying brain diseases and to develop neuroprotective and neurodegenerative therapeutic approaches. There is now accumulating evidence that on an individual level health or disease critically depends on the interaction between genes and environment. Epigenetic mechanisms such as histone-modification, DNA-methylation and non-coding RNA-mediated processes are key-regulators of gene-environment interactions. Importantly, such epigenetic mechanisms have recently been implicated with the pathogenesis of neurodegenerative and psychiatric diseases. Thus our current hypothesis is that deregualtion of genome-environment interactions, especially via epigenetic gene-expression, is a key feature of neurodegenerative diseases such as Alzheimer's disease. We combine studies in patient material, mouse and cellular models, behavioral, molecular, genetic, and bioinformatic techniques to address these questions.

Major Research Interests

Our laboratory is interested in the molecular mechanisms establishing plant innate immunity. We focus on the elucidation of signal transduction mechanisms that lead to transcriptional reprogramming in the course of plant defense responses against bacteria and fungi. Plants have developed multiple layers of defense responses against pathogens. In general, infection of the model plant *Arabidopsis thaliana* with biotrophic pathogens (pathogens that exploit resources of living cells) leads to the activation of salicylic acid (SA)-mediated defense responses, whereas infection with necrotrophic pathogens (pathogens that kill cells to obtain access to nutrients) elicits jasmonic acid/ethylene (JA/ET)-dependent responses. If plants are infected by both types of pathogens, the SA pathway represses the JA/ET pathway (cross-talk). Members of the TGA family of transcription factors have been identified as essential regulators of both responses. While the SA-mediated mechanisms that activate TGA factors have been elucidated in considerable detail it has remained unknown how these factors mediate the negative effect of SA on the JA/ET response (Zander et al., 2010; Zander et al., 2014). In this context, we have identified the family of plant-specific ROXY-type glutaredoxins, which interact with TGA factors to influence defense responses (Ndamukong at al., 2007; Zander et al., 2012). A central question in our lab is as to how ROXYs regulate the activity of TGA factors.
We combine genetic (e.g. analysis of mutants and double mutants, generation of mutants using the CRISPR/Cas genome editing system), molecular (e.g. gene expression analysis by real-time RT PCR), cell biological (subcellular localization and protein-protein-interaction studies in living cells) and biochemical (e.g. chromatin immunoprecipitation, biotin switch assays to study the *in vivo* redox state of proteins) approaches to gain novel insights into these complex mechanisms.
A further project analyzes the function of the JA receptor COI1 in the defense against the vascular pathogen *Verticillium longisporum*. Whereas COI1 usually promotes defense responses against necrotrophic fungi when activated by JA, it promotes susceptibility independently from JA in response to infection with *V. longisporum* (Ralhan et al., 2012). Our aim is to understand the activation and the downstream effects of this novel COI1 function. Moreover, we aim to elucidate the evolution of JA synthesis and COI1-dependent JA signaling in non-seed plants.

Dirk Görlich

Professor, Director at the Max Planck Institute for Biophysical Chemistry

- 1989 Diploma (Biochemistry), Martin-Luther-Universität in Halle
- 1990 – 1993 Graduate studies (Laboratory of T.A. Rapoport, Berlin)
- 1993 Dr. rer. nat. (Biochemistry) Humboldt-Universität Berlin
- 1993 – 1995 Postdoc (Laboratory of R.A. Laskey, Cambridge, England)
- 1996 – 2007 Research group leader at the ZMBH Heidelberg
- 2001 – 2007 Professor for Molecular Biology (Universität Heidelberg)
- 2007 – Director, Dept. Cellular Logistics, MPI for Biophysical Chemistry, Göttingen
- 2018 – 2019 Managing Director of the Institute

Major Research Interests

- Nuclear pore complexes, their function and assembly
- Hydrogels, “smart” materials, phase separations
- Structural biology
- Importins and Exportins, cargo recognition
- Recombinant antibodies, protein engineering

- Postdoctoral Fellow at Lab. for Physical Chemistry, ETH Zürich (1986 – 1989, Prof. Dr. R. R. Ernst)
- Full Professor for Organic Chemistry at the University of Frankfurt (1990 – 2000)
- Appointed as Director at the Max Planck Institute for Biophysical Chemistry (1999)

Major Research Interests

In the department, we develop NMR spectroscopic methods and apply them to the investigation of water soluble and membrane proteins, nucleic acids and their complexes as well as drug/target complexes. We are specifically focussing on the dynamics of biomolecules. Structural biology projects are performed in the context of signal transduction, ion channels, cytoskeletal proteins, enzymes and drug/target complexes using NMR as well as X-ray crystallography to characterize structure and dynamics. An applied project is the investigation of proteins involved in neurodegenerative diseases that are studied in the context of the CNMPB and involve NMR and other biophysical methods as well as chemical synthesis. Methods developments are aimed at pushing the limits of sensitivity for NMR spectroscopic detection (e.g. DNP), developing the measurement of structurally and dynamically relevant parameters, establishing methods to describe structural ensembles for folded and intrinsically disordered proteins. For solid state NMR investigations, pulse sequences that allow structure determination of uniformly labelled membrane proteins as well as oligomers and fibrils formed from proteins involved in neurodegenerative diseases have been successfully developed.

Uwe Groß

Professor of Medical Microbiology

- Professor of Bacteriology and Head, Institute of Medical Microbiology, University Medical Center Göttingen since 1999 (co-opted Professorship, Faculty of Biology since 2005)
- Professor of Medical Parasitology, University of Würzburg 1998/1999
- Postdoctoral fellow, UC Los Angeles, California, 1987 – 1989
- M.D., University of Hamburg 1987

Major Research Interests

The Institute of Medical Microbiology is trying to understand infectious diseases by linking applied and basic sciences, e.g. aspects of epidemiology and pathogenesis. In regards to bacteriology, we are focusing on the intestinal pathogens *Campylobacter jejuni* and *Clostridium difficile*, where we use molecular approaches to identify and characterize virulence-associated factors, such as those involved in invasion (*Campylobacter*) or in spore regulation (*Clostridium*). In addition, the epidemiology of both pathogens in different regions and environments is under investigation.
Fungal infections caused by *Candida* and *Aspergillus* is a second major research topic. Like in bacterial infections, antimicrobial resistances are an emerging threat in mycology as well. Therefore, we focus on analyzing the epidemiology and the mechanisms of antifungal resistances, but are also investigating fungal factors and mechanisms that are involved in pathogenesis of mycoses.
The protozoan parasite *Toxoplasma gondii* usually causes asymptomatic infections in immunocompetent adults leading to lifelong persistence especially in the brain and in muscle tissue. Infections are especially dangerous during pregnancy and in immunocompromised individuals (i.e. patients suffering from AIDS). We are interested in the epidemiology of toxoplasmosis as well as in the cross-talk between the parasite and its host cell on a molecular level. Here, we investigate how the parasite (i) modulates the host cell capacity for MHC-restricted antigen presentation and (ii) inhibits apoptosis of the infected cell. Both mechanisms allow intracellular persistence.
Recently, we also started to develop the theme Global Health in regards to infectious diseases and cooperate with scientists from Ghana, Kenya, and Tanzania

Major Research Interests

Biological structure formation and ageing.
Our group is interested in the molecular and cell-biological mechanisms how biological structures are formed. We analyse structure formation in the early *Drosophila* embryo employing genetical, biochemical and embryological experiments as well as live-imaging. Specifically we investigate how nuclear shape is determined and how the farnesylated protein Kugelkern is involved, how the cells are regularly arranged, how apical-basal polarity is established and how the number of synchronous cell divisions is robustly controlled. Based on our studies nuclear shape we have studied the function of the nuclear lamina and lamina proteins, such as lamin and Kugelkern, in ageing and stem cell proliferation and differentiation in the adult fly.

Major Research Interests

The question ‘How do proteins work?’ is our driving force. We study biomolecular dynamics and function by atomistic molecular dynamics and qm/mm simulations. Emphasis is on protein function, as well as on protein/DNA/RNA interactions.
Available projects address nuclear pore transport, the ribosome, molecular motors such as F-ATPase, protein unfolding as well as the interaction with radiation with a focus at single molecules, typically in close collaboration with experimental groups. The simulation of single molecule AFM experiments by force probe techniques helps us to reveal mechanisms of protein function involving mechanical stress such as the muscular force sensor titin kinase, and so do improved methods to calculate thermodynamic quantities from simulations. We are continuously advancing our simulation techniques and scalability on massively parallel computers. The group of ca. 20 PhD students and postdocs shares a strong background mainly in physics, and scientific computing, but also in chemistry and biology. We enjoy exclusive access to a high-performance linux cluster of ca. 20.000 processor cores and ca. 1250 GPUs.

Major Research Interests

Our research focuses on understanding the development of mammalian primordial germ cells (PGCs), the precursors of sperm or egg. Hence, PGCs represent the only cell type that transmits genetic and epigenetic information to the next generation. In mammals, the developing embryo forms the postimplantation epiblast, the founder cell population of all embryonic cell types. While most of these cells give rise to organs and tissues, a few are set aside to become PGCs. Shortly after, PGCs undergo reprogramming including extensive transcriptional changes accompanied by epigenetic alterations. Our work addresses the fundamental questions: How is the transcriptional programme controlled and what are the functional implications of epigenetic modifications in PGCs? To address these questions, we make use of *in vivo* and *in vitro* model systems of PGC differentiation, genome-wide techniques and the CRIPSR/Cas9 genome editing tool.

Major Research Interests

Cancer is a disease that results from inappropriate cell division induced by hyperproliferation. In many cases, the development of cancer is associated with genes or signaling pathways important for patterning during embryogenesis.
We investigate the role of the Hedgehog/Patched (Hh/Ptch) signaling cascade in the development of solid tumors. The focus is on rhabdomyosarcoma and basal cell carcinoma. In addition, we are investigating the role of Hh/Ptch signaling in cutaneous squamous cell carcinoma and adenoma of the pituitary gland.
The first aim is the discovery of molecular and cellular events that trigger the initiation of Hh associated tumors. The second aim is to elucidate the function Hh signaling during tumor progression. The third goal is the identification of drugs that target Hh/Ptch-associated solid tumors. To test the anti-tumor activity of the drugs we use tumor-bearing Ptch mutant mice.

Major Research Interests

Research in our laboratory is focused on the Unfolded Protein Response (UPR) in development and disease signaling. Cells need to re-adjust and modify their cellular programs in response to a wide range of biotic and abiotic stimuli. The UPR is a highly conserved cellular response to maintain homeostasis of the endoplasmic reticulum (ER). In situations of increased demands for protein production and secretion, potentially harmful un- or mis-folded proteins accumulate in the ER and activate the UPR pathway. Defects in UPR signaling are associated with a wide range of developmental, metabolic and neurodegenerative disorders. Besides the role as a cellular stress response, recent work demonstrated that the UPR pathway is also involved in control of developmental processes. We uncovered that UPR signaling in the phytopathogenic fungus Ustilago maydis is required for disease development and directly coupled to the pathways that control parasitic growth of the fungus. Our future studies will aim to characterize these connections on a molecular level and further explore the role of UPR signaling in controlling cellular behavior and responses to different environments.

Major Research Interests

Our research is focused on the chemistry and biochemistry of natural and artificial nucleic acids.
Functional nucleic acids with new properties can be identified in the laboratory by *in vitro* selection. We use this method to develop catalytic DNA and RNA for labeling and ligation reactions of biomolecules, and we explore functional and structural properties of deoxyribozymes and fluorogenic aptamers. Recently we reported the first crystal structure of a catalytic DNA which allowed mechanistic insights into the regioselectivity of DNA-catalyzed RNA ligation and enabled engineering of DNA enzymes for substrates that could previously not be used in DNA-catalyzed ligations.
In addition, we investigate natural modifications of DNA and RNA and develop labeling methods for their biochemical and spectroscopic detection, with particular emphasis on the emerging field of posttranscriptional RNA modification.

Major Research Interests

Our group is interested in the mechanisms of membrane fusion, with the main emphasis on regulated exocytosis in neurons. Intracellular membrane fusion events are mediated by a set of conserved membrane proteins, termed SNAREs. For fusion to occur, complementary sets of SNAREs need to be present on both of the fusing membranes, which then assemble in a zipper-like fashion to initiate membrane merger. The neuronal SNAREs are among the best characterized. They are the targets of the toxins responsible for botulism and tetanus, and they are regulated by several addtional proteins including synaptotagmin, the calcium sensor for neurotransmitter release. To understand how these proteins mediate fusion, we study their properties in vitro with biochemical and biophysical approaches using native and artificial membranes.
In a second set of projects, we are interested in the mechanisms by which synaptic vesicles sequester and store neurotransmitters. Uptake is mediated by specific vesicular neurotransmitter transporters that are energized by an electrochemical proton gradient across the membrane. Presently we aim for a better understanding of the transport mechanisms using a variety of biochemical and biophysical approaches including imaging of single vesicles. Finally, we use quantitative proteomics to better understand how the presynaptic protein network contributes to the regulation of synaptic release, focusing on protein phosphorylation.

- 2010 – Professor (W2) of High Resolution Microscopy in Neurodegenerative Diseases, University of Göttingen Medical School, Dept. of Neurology

Major Research Interests

Our two major research interests are the investigation of the nanoscale architecture and dynamics of mitochondria and the analysis of reversibly switchable fluorescent proteins (RSFPs) as probes for super-resolution microscopy. Mitochondria are essential organelles in all eukaryotic cells and their dysfunction is involved in many devastating (neurodegenerative) diseases. We want to understand the organization of mitochondria on the nanoscale in healthy and challenged cells and investigate the molecular mechanisms that determine their intricate structure. We utilize a wide array of techniques, including molecular biology, biochemical methods as well as electron and super-resolution microscopy.
RSFPs are fluorescent proteins that may be switched by light between a non-fluorescent and a fluorescent state. Their unique properties open up numerous applications in microscopy and cell biology. We investigate the molecular switching mechanisms and aim to improve the properties of these fascinating proteins as probes for live-cell super-resolution microscopy.

Major Research Interests

The long-range transport of membrane organelles in neurons depends primarily upon microtubules and motor proteins that move unidirectionally along these tracks. One type of microtubule-based motor proteins powering membrane transport is the kinesin superfamily. We are interested in how these motors achieve specificity in cargo binding, elicit membrane transport, and the regulation of transport activity. In addition, the fascinating organization of the muscle's sarcomere guides our research in understanding the orchestration of individual constituents in muscle contraction. Using fluorescently tagged motor and vesicle markers we investigate these questions in the nervous system of the nematode *C. elegans* serves us as a model system for microscopic tools (confocal, TIRF, FRET FLIM) and biochemical transport assays *in vitro*.

Major Research Interests

Working in the Department of Molecular Genetics, which is headed by Prof. Dr. H. Krebber, my major scientific interest is focused at present on the interplay of RNA metabolism with other cellular pathways, namely DNA replication/DNA repair and cell cycle/cell division. There is strong genetic evidence that the RNA-binding SR-protein Npl3 from budding yeast, which is involved in many RNA-related cellular processes, also plays an important role in the maintenance of genome stability. We want to further understand the connections between these seemingly unrelated processes. One clue comes from the finding of other labs that RNA-DNA hybrids, so called R-loops, can induce DNA damage and homologous recombination. We try to find out, where in this process Npl3 might be involved, combining genetical and biochemical approaches.

Major Research Interests

mRNA quality control:
Messenger RNAs are transcribed in the nucleus and translated in the cytoplasm. Thus, it has to be assured that intron containing pre messenger RNAs are retained in the nucleus until processing is completed. RNA quality control allows only fully processed and spliced mRNAs to be transported and translated. Defects lead to diseases such as cancer and neurodegenerative diseases. Our projects functionally study mRNA quality control.

ncRNA functions:
non coding (nc)RNAs make up more than half of all RNAs in cells. However, the knowledge about their cellular functions lack far behind the knowledge of coding mRNAs. In this project we are investigating the function of individual lncRNAs, e.g. those involved in cellular iron metabolism, important to understand iron-related diseases, or the telomerase, important for the unlimited growth of most cancer cells.
We use the eukaryotic model organism *Saccharomyces cerevisiae* that has proven to be pioneer organism for studying fundamental basic scientific questions.

Major Research Interests

Oocyte meiosis is a form of cell division specialized to produce the fertilizable egg. Our main interest is understanding how the cell division machinery, the cytoskeleton in particular, adapted to carry out these specialized divisions. For example, oocytes are exceptionally large cells storing nutrients for the embryo that divide very asymmetrically in order to retain these nutrients in a single egg cell. How does the cytoskeleton support divisions in this extreme geometry? Indeed, we showed that, compared to mitosis of small somatic cells, additional, meiosis-specific mechanisms are required. Interestingly, we found that while in somatic cells microtubules dominate, in the oocyte key functions are taken over by the actin cytoskeleton; for example, an actin net transports chromosomes to the forming spindle and actin is also involved in regulating spindle assembly. To explore the conservation and diversity of these meiosis-specific functions, we are using marine model species such as the oocytes of starfish. These oocytes are highly transparent, exceptionally resistant to light and easy to handle, rendering them an excellent model for live cell microscopy. In our future work we aim to further establish these marine models by developing advanced imaging assays and tools for targeted molecular perturbations. In turn we will use these tools to further dissect mechanisms of meiotic divisions. Studying oocyte meiosis is important, as a euploid egg is at the origin of life of any healthy animal and human individual, while the mechanisms are still poorly understood. In addition, understanding how cell division adapted and diversified to such specialized functions will reveal general principles of cellular organization.

Major Research Interests

Our department is interested in the molecular analysis of plant innate immunity.
Our research is focused on the
1) molecular dissection of mechanisms that control activation of basal defense in the plant model Arabidopsis thaliana (chitin receptor complex formation & processing; downstream signal transduction; cell death activation and containment) [e.g. Erwig et al., 2017; Petutschnig et al., 2014]
2) analysis of plant defense mechanisms that contribute to resistance against fungal pathogens (pathogen invasion control; pathogen-induced cell polarization; orchestrated organelle relocalization; subcellular compartmentalization; production, transport & discharge of toxic metabolites) [e.g. Fuchs et al., 2016]
3) identification of fungal effector molecules that interfere with the plant defense machinery and allow host plant colonization (effector-mediated reprogramming of host plant development; pathogen-induced drought stress tolerance) [e.g. Reusche et al. , 2012; Reusche et al., 2014].

We combine genetics, cell biology, molecular biology and biochemistry in our experimental strategies to gain novel insights into these complex mechanisms.

Major Research Interests

Most metazoan pre-mRNAs contain multiple introns and exons. In order to generate mature mRNA, the introns must be excised from the pre-mRNA, a process termed pre-mRNA splicing. In many cases, alternative splicing generates different mRNAs from a single pre-mRNA by the regulated removal of different sections of the RNA, a process which greatly expands the complexity of the repertoire of proteins that can be expressed from relatively small genomes. Splicing is catalysed by a large macromolecular machine, termed the spliceosome which consists of the small nuclear RNAs (U1, U2, U4, U5 and U6) and more than 150 proteins, 50 of which are associated with the snRNAs to form snRNPs.
In our laboratory, intense efforts are focussed on understanding how the spliceosome recognizes and binds the intron ends and discriminates them from exons. This is an especially confounding problem in metazoans because, in contrast to lower eucaryotes such as yeast, pre-mRNA introns are often extremely long (104-105 nucleotides), while exons are generally small (less than 300 nucleotides). Another major goal of our research is the elucidation of the mechanisms by which the spliceosome assembles into a catalytically active machine and catalyses intron excision. None of the building blocks of the spliceosome contains an active site. Instead, the catalytically active domain must be assembled anew on to each intron, a highly dynamic process which entails dramatic structural rearrangements of the RNP structure of the spliceosome, and which is orchestrated by the successive action of more than 10 enzymes such as RNA helicases and GTPases, as well as by posttranslational phosphorylation of a multitude of spliceosomal proteins. Our studies involve a large number of experimental approaches, including biochemical purification of entire spliceosomes or large protein ensembles, and characterization of their proteins by mass spectrometry; RNA biology methods such as enzymatic engineering of RNA molecules, RNA structure probing and RNA interference methods; production of recombinant proteins and antibodies; procedures for the investigation of protein-protein and protein-RNA interactions *in vitro* and *in vivo*; and biophysical methods such as fluorescence spectroscopy.
Finally, we are investigating the 3D structure of purified spliceosomes or major building blocks thereof using electron microscopic approaches and X ray crystallography. Our studies on the regulatory mechanisms of constitutive and alternative pre-mRNA splicing involve mainly mammalian systems. As the basic mechanisms of splicing catalysis appear to be evolutionarily highly conserved, we are also taking advantage of molecular genetic approaches in baker yeast to elucidate the structure and function of the catalytic core domain of the spliceosome.

Major Research Interests

The focus of our research work is algorithm and software development for nucleic acid and protein sequence analysis; the multiple-alignment program “DIALIGN” and the gene-finding program “AUGUSTUS” are widely used tools that have been developed in our department. More recently, we started to work on word-matching statistics and on alignment-free approaches to comparative sequence analysis, here we developed the tools “Filtered Spaced Word Matches”, “kmacs”, “Prot-SpaM”, “Multi-SpaM” and “Read-SpaM”.
Other areas of research in our department include phylogeny reconstruction, metagenomics, motif discovery and remote homology detection using machine learning methods, and genome annotation for prokaryotes.

Major Research Interests

Auditory Neuroscience - Synaptic Physiology and Pathophysiology – Audiology and Neuroprosthetics

Our work focuses on the molecular physiology and pathophysiology of sound encoding at the hair cell ribbon synapse and its restoration. We have physiologically and morphologically characterized synapses of wild-type and mutant mice with defects in hair cell synaptic coding from the molecular to the systems level. This way we have contributed to the understanding of structure and function of the hair cell ribbon synapse and co-initiated the concept of auditory synaptopathy. Molecular dissection and detailed physiological characterization of ribbon synapse function employ a spectrum of molecular, biophysical, physiological, psychophysical and clinical approaches. Towards restoration of hearing we pursue the optogenetic stimulation of cochlea and gene replacement therapy.

Major Research Interests

We are studying the interactions of neurons and glial cells in the mammalian nervous system with a special interest in the role of oligodendrocytes and Schwann cells, best known as myelin forming cells of the central and peripheral nervous system. These highly specialized glial cells enwrap axons with a multilayered sheath that provides electrical insulation for rapid impulse propagation. However the biology of these axon-glia interactions is complex. Using mouse genetics, originally to study the role of proteins in the myelin architecture and in neurogenetic disorders, we made the unexpected discovery of a novel function of oligodendrocytes, which even precedes myelin in nervous system evolution: the glial metabolic support of axonal conduction, axonal transport and long-term integrity. We determined that oligodendrocytes and Schwann cells take up glucose and deliver lactate, here the product of aerobic glycolysis, to the axonal compartment. This supportive function helps maintaining axon functions especially when ATP demands are increased at higher firing rates, also because access of axons to extracellular metabolites is restricted by myelin itself. Here, the fine architecture of the myelin sheath that we visualize with advanced electron microscopic techniques appears critical. Specialized cytoplasmic connections within the myelin sheath ('myelinic nanochannels') must provide a pathway of continuous communication between oligodendrocytes and the encapsulated axon. In neurological diseases, in which myelin is structurally affected or even destroyed, such as in multiple scleroses, leukodystrophies and various peripheral neuropathies, there is invariably secondary axonal degeneration that we propose is caused by the lack of adequate metabolic support. We are investigating the underlying molecular mechanisms of these diseases in detail, using corresponding animal models that we have generated with a range of genetic techniques. A further goal is to understand the role of myelinating glial cells in higher brain functions and psychiatric diseases, which we approach in close collaboration with the Department of Hannelore Ehrenreich at our institute.

Major Research Interests

We wish to uncover the rules governing gene expression in response to developmental and extra-cellular cues. Genome architecture is thought to be a major determinant in this. What we strive to understand is how chromatin (re)folds to accommodate responses to such cues in 3D nuclear space and dynamically over time. In the end, we anticipate these rules to be general ones, which once deciphered will allow us to predict how a cell might respond upon signalling, in the context of disease, or during cellular ageing.

Major Research Interests

Fruiting-body development in filamentous ascomycetes

Fruiting-body development in filamentous ascomycetes is a complex cellular differentiation process that requires special environmental conditions and is controlled by many developmentally regulated genes. We are interested in the genes regulating this development process. We use the homothallic (self-fertile) ascomycete *Sordaria macrospora* as a model organism. Numerous mutants which are blocked at various stages of fruiting-body development have been generated and molecular genetic procedures have been applied to isolate genes involved in fruiting-body development. In addition to mutants generated by chemical mutagenesis, several mutants affecting fruiting-body development were produced by knock-out of mating-type genes, pheromone and receptor genes, as well as genes involved in autophagy and bicarbonate metabolism.

Autophagy in filamentous ascomycetes

Autophagy is defined as a tightly controlled non-selective degradation process in which eukaryotic cells digest their own proteins and organelles in response to starvation or stress conditions. In filamentous ascomycetes, autophagy is involved in various developmental processes. However, the exact role of autophagy in multicellular fruiting-body development is largely unknown.

Using a reverse genetics approach, we have recently shown that the autophagy genes *Smatg8* and other conserved genes required for core functions of the selective and non-selective autophagic machinery are essential for fruiting-body development in the filamentous ascomycete *Sordaria macrospora*. Our aim is to understand how selective autophagy contributes to vegetative growth and fruiting-body development in filamentous ascomycetes.

Major Research Interests

Influenza viruses pose a global health threat. These viruses constantly change and therapeutics may thus cease to be effective. Therefore, we seek to develop novel influenza therapies. One focus of our work is on the host cell protease TMPRSS2 since we obtained evidence that influenza viruses depend on this enzyme for acquisition of infectivity. Moreover, we are investigating how defective interfering particles (DIPs) can be developed as novel therapeutics.
Emerging viruses may cause severe disease. Outbreaks frequently occur abroad but the agents can be imported into Germany via infected travelers. We are investigating how emerging viruses interact with host cells and cause disease. Our focus in on lymphocytic choriomeningitis virus, Ebola virus and MERS coronavirus. One aim of our research is to develop cell culture systems that allow predicting transmissibility and thus pandemic potential of emerging viruses.
Another focus of our research is on primate herpesviruses. The transmission of herpes B virus from macaques to humans can cause serve disease while closely related viruses seem to be apathogenic in humans. We are investigating which viral and host factors determine whether infection will result in severe disease. Moreover, we are developing diagnostics for herpesvirus infections of non-human primates.

Major Research Interests

We are interested in understanding the molecular mechanisms by which proteins are transported across the mitochondrial membranes and to find out how multi-protein complexes in the inner membrane (TIM complexes; translocation machineries of the inner membrane) mediate this task. In another aspect of our work we address how translation of mitochondrial-encoded proteins on organellar ribosomes is regulated. The analysis of the principles of the biogenesis of mitochondrial proteins and protein complexes is of central importance for our understanding of the molecular basis of human mitochondrial disorders. In this context we analyze the molecular pathology of a number of human disease models utilizing mice models, knock out cell lines, and iPSC-derived cardiomyocytes. Our analyses aim to understand how mitochondrial functions are integrated into the cellular context.

Major Research Interests

Regeneration, the ability of many animal or plant species to re-grow lost body parts, raises many intriguing questions. For example, what defines the shape, size, and proportions of the regenerating body part? After an injury, how can the remaining tissue 'sense' what's missing? Why is that regeneration seemingly the exception rather than the rule? Or why We use planarian flatworms as model system. Thanks to their abundant pluripotent adult stem cells, many planarian species have the fascinating ability to regenerate complete animals from tiny tissue pieces. Moreover, they continuously renew all cell types even in absence of injury and the resulting dynamic tissue architecture manifests for example in the food-supply dependent bi-directional scaling of body size over a > 40-fold range in body length, a >800-fold range in cell numbers or close to a 10,000 fold range in weight1. And some species continuously grow and shrink, while others age and die.
Our department uses a highly interdisciplinary compendium of methods to study these fascinating phenomena. We probe the self-organizing signaling systems that specify the planarian body plan in terms of biochemistry and cell biology2,3. We sequence genomes4 and develop functional genomics approaches in order to understand how patterning signals program stem cell progeny fate choices or how signaling networks form spatial activity patterns. We explore the quantitative basis of pattern formation, scaling, and size specification in close collaborations with physicists and theoreticians1,2,5. And through worldwide field sampling, we maintain a "zoo" of > 50 planarian species to mechanistically compare regenerative abilities6, body sizes and shapes, organismal life spans, or reproductive strategies between species.
In a nutshell: We study fundamental molecular/cell biological mechanisms and how and why they change in evolution.

Group Leader STED Microscopy of Synaptic Function

- 2000 – 2004 Research assistant with William Betz at the Dep. of Physiology and Biophysics, University of Colorado Health Sciences Center (USA)
- 08/2004 PhD degree (Physiology) awarded by the University of Colorado
- 2004 – 2007 Post doctoral fellow with Reinhard Jahn at the Neurobiology
- Department of the Max Planck Institute for Biophysical Chemistry in Göttingen (Germany)
- since 2007 Group Leader (STED Microscopy) at the European Neuroscience Institute Göttingen (ENI-G)

Major Research Interests

Conventional fluorescence microscopy is limited by the diffraction of light: fluorescent objects that are close together cannot be discerned. Stimulated emission depletion (STED) is a recent advancement in optical physics that breaks the diffraction barrier, allowing microscopes to obtain much clearer images.
The diffraction barrier has been particularly problematic for imaging synaptic vesicles, which are among the smallest known organelles (30-50 nm in diameter). They are located in small areas in the synapses (about 1 micron in diameter). The group takes advantage of the increased imaging resolution provided by STED to investigate synaptic vesicle function, with an emphasis on synaptic vesicle recycling. Since STED microscopy also allows imaging of protein domains, the group aims at studying the patterning of protein domains in the synapse, in order to understand its molecular architecture.

Major Research Interests

1. Ribosome function and dynamics
2. Regulation and fidelity of translation
3. Ribosome-catalyzed reactions

Protein synthesis from amino acids in the cell is performed on ribosomes, large ribonucleoprotein particles that consist of several RNA molecules and over 50 proteins, augmented by auxiliary translation factors. One important unresolved question is the relation between the speed and fidelity of protein synthesis, which are two fundamental parameters that define viability and fitness of cells. While normal decoding is very accurate, is special cases the ribosome can overcome the rules of normal translation to recode parts of the genome in an alternative way. Incorporation of unusual amino acids, such as selenocysteine, requires highly specialized machinery for delivery. Understanding the the movement of tRNAs and mRNA through the ribosome remains a major challenge. Finally, the processivity of the ribosome on the mRNA track, discontinuous translation and vectorial co-translational protein folding are open challenging questions. We investigate translation using a combination of techniques from Biochemistry, Structural Biology and Physical Biochemistry. Development of highly efficient and controlled ribosome translation systems on a highly sophisticated technological level is important for production of proteins with desired properties for purposes of proteomics and high-throughput structural studies emerging in the post-genomic era. The translational apparatus is a major target for antibiotics. Better understanding of the mechanisms of antibiotic action, resistance mechanisms and the interplay between resistance and bacterial fitness will be increasingly important for developing new antimicrobials and combating the major infectious diseases.

Major Research Interests

We study meiosis in mammalian oocytes, the progenitor cells of eggs. This topic is of great interest for fundamental research because meiosis is still much more poorly understood than mitosis, especially in mammals. It is also of direct medical relevance because defects in eggs are the leading cause of pregnancy loss and several congenital disorders such as Down's syndrome. Our main aim is to understand how defects at the interface between chromosomes and cytoskeletal structures lead to aneuploid eggs and pregnancy loss in mammals. To this end, we study how the meiotic spindle is organized, how it segregates the chromosomes and how the spindle interacts with actin to drive the meiotic divisions. To have a solid foundation for future research, we are also developing new tools to study meiosis in mammalian oocytes. For instance, we have been able to carry out the first high content screen for meiotic genes in mammals. We also developed Trim Away, a method for rapid degradation of endogenous proteins. We have also been able to establish methods that now allow us for the first time to study the causes of chromosome segregation errors directly in live human oocytes. This has opened an exciting new area of research in my laboratory that we plan to expand significantly in the future.

- since 2010 the group is associated with the Max Planck Institute for Biophysical Chemistry

Major Research Interests

The group works on different aspects of membrane protein biogenesis and its integration into the physiology of organs such as the brain or the heart. We study the early life of tail-anchored proteins that are post-translationally targeted to the endoplasmic reticulum for membrane integration. Other projects address the role of sorting motifs during the passage of ion channels and neurotransmitter receptors through the secretory pathway. One channel under investigation (the KATP channel) couples cellular metabolism to insulin secretion in pancreatic beta cells. In the brain and the heart KATP channels play less defined roles that we currently address employing biochemical methods. We study biogenesis and trafficking under (patho)physiological conditions in genetically tractable model organisms such as yeast or mouse. Besides membrane protein biochemistry we use GFP-based physiological sensors for small molecules and ions in cellular compartments. This allows us to tackle how ion channels and transporters contribute to different physicochemical milieus inside cells.

Major Research Interests

The work in our group is focused on 3D structure determination of large macromolecular complexes by single particle electron cryomicroscopy (cryo-EM). In cryo-EM, thousands of electron microscopical images of a macromolecular complex are taken at low temperature in the electron microscope and are used to calculate a 3D reconstruction of the object by computational image processing. Electron microscopical images can be considered as almost ideal two-dimensional projection images, similar to images obtained by computer tomography in medical applications. However, in cryo-EM the relative orientation of the molecules is a priori unknown and must be determined by computational means prior to calculating the 3D structure.

Cryo-EM is the method of choice for 3D structure determination of macromolecular complexes that are difficult to purify in the amounts and quality that is required for crystallization (X-ray crystallography). Due to the low copy number of many functionally important macromolecular complexes in the cell, cryo-EM is very often the only available method to study the 3D structure of these large macromolecules. Work in our group concentrates on macromolecular complexes related to pre-mRNA splicing, translation and cell cycle regulation and on the development of new methods to improve sample preparation, imaging and computational image processing techniques

Major Research Interests

The removal of misfolded proteins is an essential process in all cells. Failure to discard such proteins often results in disease. A particularly intriguing process serves to discard misfolded proteins from the endoplasmic reticulum (ER). The ER does not itself degrade proteins, so a machinery has evolved that moves misfolded proteins into the cytosol where they can be degraded by the proteasome. This retro-translocation process is called ERAD (for ER-associated protein degradation) and is conserved in all eukaryotes. Besides its function in the removal of misfolded proteins, it plays an important role in the controlled degradation of metabolic enzymes, like the ones involved in sterol biosynthesis. The ERAD pathway is also co-opted by certain viruses (e.g. Human cytomegalovirus) and bacterial toxins (e.g. cholera toxin).
Compared to other membrane translocation processes, the mechanism of ERAD is still poorly understood. How are misfolded proteins distinguished from folding intermediates? How are proteins moved across the membrane? How are they extracted from the membrane? How is the energy for membrane translocation provided? The aim of our research is to provide answers to these fundamental questions. To study the mechanism of ERAD we use the budding yeast *Saccharomyces cerevisiae* as a model organism. We take a bottom-up approach and try to understand the mechanism of ERAD by reconstituting the entire process with purified individual components. These experiments will be complemented by studies in intact yeast cells.
In a second project, we investigate an ERAD-like process that moves proteins into the apicoplast, a plastid-like organell in unicellular parasites, like the malaria parasite *Plasmodium falciparum*. The apicoplast performs metabolic reactions essential for the parasite's survival, which include the synthesis of lipid precursors, heme and iron-sulfur clusters. The apicoplast is the target of many antimalarial drugs. We hope that a better understanding of its cell biology will facilitate the development of new drugs against malaria.

Major Research Interests

Our group studies the regulation of metabolism in the pathogenic bacterium *Mycoplasma pneumoniae* and the model organism *Bacillus subtilis*. We are following global ("post-genomic") and gene-specific approaches. In *Mycoplasma pneumoniae*, we study the regulation of gene expression in this pathogenic bacterium and its relation to pathogenicity. This is highly interesting because this bacterium is an important cause of pneumonia. Moreover, *M. pneumoniae* is one of the organisms with the smallest genetic equipment that is capable of independent life. Understanding *M. pneumoniae* means understanding life! Specifically, we are analysing protein phosphorylation and mechanisms of transcription regulation in *M. pneumoniae*. We have shown, that protein phosphorylation of is of key importance for pathogenicity of *M. pneumoniae*. Metabolism in *Bacillus subtilis* is studied by transcriptomics, metabolome and fluxome analyses. Our specific interests are focussed on two key pathways: glycolysis and glutamate biosynthesis, the decisive link between carbon and nitrogen metabolism. The regulation of glycolysis is studied at the level of a controlled protein-RNA interaction. Regulation through RNA has become widely recognized in the past few years. Our studies revealed that glycolytic enzymes themselves are part of a protein complex that is required for mRNA processing and degradation. Finally, we are interested in systems biology approaches to the analysis of *B. subtilis* and develop web interfaces for the functional annotation.

Major Research Interests

We are studying the molecular mechanism of autophagy in the yeast *Saccharomyces cerevisiae*. Autophagy is a starvation induced transport pathway, which delivers cytosolic material for degradation to the lysosome (vacuole). It is highly conserved in all eukaryotes from yeast to human and helps the cells to survive periods of nutrient limitation.

Autophagy further plays an important role in ageing, the development of breast cancer and cardiomyopathy and it was linked to neurodegenerative diseases like Alzheimer´s, Huntington´s and Parkinson´s disease. Autophagy is mechanistically unique, since its transport intermediates, the autophagosomes, are surrounded by two individual membranes. It starts at the newly-discovered preautophagosomal structure, where autophagosomes are formed. Autophagosomes unspecifically enclose parts of the cytoplasm including organelles like mitochondria, peroxisomes and parts of the ER.

When the autophagosomes reach the vacuole, their outer membrane-layer fuses with the vacuolar membrane and a still membrane-enclosed autophagic body is released into the vacuolar lumen. In the vacuole autophagic bodies are lysed and broken down together with their cytosolic content. The intravacuolar breakdown of autophagic bodies requires the selective lysis of their limiting membrane. Due to the use of two limiting membranes the biogenesis of autophagosomes is a very unique process. Molecular dissection of this process is one of our main areas of research.

Major Research Interests

The central research topic of our department is the analysis of molecular reaction mechanisms of enzymes as nature's chemical catalysts. In this context, we study enzymes with vitamin-derived cofactors, with metal ions, and Schiff base-forming enzymes. A particular focus is laid on the structural and kinetic characterization of enzymatic reaction intermediates by high-resolution X-ray crystallography, steady-state and transient kinetic methods, NMR spectroscopy and theoretical studies. Knowledge about the reaction mechanism is exploited to redesign enzymes for biocatalytic applications and for drug design.

- 1987 – 1993 Studied biochemistry at the Free University of Berlin, Germany

Major Research Interests

Modern mass-spectrometric methods have become key technologies in the life sciences. We apply “state-of-the-art” mass spectrometry to elucidate quantitative changes of proteins and their post-translational modifications derived from different samples, including tissue, cells, organelles, and cell compartments. In addition, we apply mass spectrometric (MS) methods to monitor dynamic changes of protein and protein-ligand complexes through use of crosslinking. Following main projects are investigated by the use of MS are: 1. Monitoring protein abundance, modifications and interactions in the non-stimulated and stimulated synapse by MS, 2. Protein-protein cross-linking combined with MS in stimulated and resting B cells, 3. Method development in protein-protein, protein-RNA and protein-DNA cross-linking combined with MS.

Major Research Interests

Natural killer (NK) cells belong to the lymphocyte lineage and represent an essential part of the innate immune system. NK cells can kill other cells and secrete substantial amounts of cytokines. Signals from activating and inhibitory NK cell receptors are integrated and regulate the activity of NK cells. Typical targets for NK cell killing are virus-infected or malignant cells, which both frequently reveal changed patterns of ligand expression on their cell surface. Such changes are recognised by NK cells, leading to killing of virally infected or transformed cells. NK cells can also be activated by different stimuli during interaction with dendritic cells, leading to release of pro-inflammatory cytokines and anti-viral substances. Due to these properties, NK cells play also important roles in autoimmune diseases, transplantation, and reproduction. Recently, NK cells were shown to possess immunological memory. Our interests lie in biology and genetics of natural killer (NK) cells, including regulation of NK cell receptor gene transcription, specific interactions of NK cell receptors and MHC class I ligands, regulation of NK cell activation, NK cell transcriptomics and the role of long noncoding RNA in NK cell development.
A further focus of our research is genomics of nonhuman primates with phylogenetic, demographic, evolutionary, and bioinformatic analyses.
Methods: single-cell RNA sequencing, single-cell qRT-PCR, flow cytometry, next-generation sequencing, bioinformatic analysis tools.

Major Research Interests

The signature structure of B lymphocytes is their clonotypic antigen receptor (BCR), which recognizes extracellular pathogens or toxins, and consequently initiates their combating by soluble antibodies. Our research focuses on how the ligated BCR activates intracellular signaling pathways upon primary and secondary antigen encounter. Our studies showed that BCR classes expressed on antigen-experienced, so-called memory B cells, possess a signal amplification mechanism that lowers the BCR signaling threshold compared to newly generated B cells. This finding provides a molecular explanation for immunological memory which is the fundamental basis for successful vaccination strategies. We also identified key effector proteins of the BCR such as SLP-65 or CIN85. They function as adaptor proteins which nucleate the formation of multi-molecular protein complexes to integrate and amplify BCR signals. Interference with expression or function of these effectors cause severe immuno-deficiencies in mouse and man. To investigate these processes we apply cutting edge technologies of biochemistry and genetics including protein interaction studies, flow cytometry, targeted gene disruption in cell culture and embryonic stem cells followed by reconstitution experiments using electroporation techniques or retroviral gene transfer

Major Research Interests

Research efforts in our laboratory are directed towards understanding the molecular mechanisms that regulate spatial communication between the cytoplasm and the nucleus in plant cellular immunity to pathogenic microbes, using *Arabidopsis* as model organism. We employ biochemical, cell biological, genetic and molecular approaches to study the functions of nuclear transport receptors (NTRs) and nuclear pore complex proteins (Nucleoporins) that are essential for plant disease resistance and control nucleocytoplasmic trafficking of proteins and RNAs. Our studies further include affinity purification approaches coupled with mass spectrometry, forward and reverse genetics to identify novel biochemical and genetic interactors required for plant defense. Another line of research is aimed at exploring molecular functions of secreted fungal effector proteins that are targeted into host cell nuclei during infection and at identifying respective host cell NTRs that mediate nuclear effector translocation.

Major Research Interests

Phylogenetic Variance and Plasticity of Developmental Processes. A key question in evolutionary developmental biology is how diverse animal body plans are specified. To identify the plasticity in developmental processes, we study their conservation and divergence in different arthropod species by transgenesis and functional genomics approaches. This will help us to understand how animal evolution is based on changes in gene regulation governing pattern formation and sex determination processes.
Smelling Beetles: Stink Glands and Odour Detection the Red Flour Beetle *Tribolium castaneum*. Beetles are prolific producers of repellent and/or toxic compounds. Defensive substances are usually multifunctional: as repellents, toxicants, insecticides, or antimicrobics, they are directed against a large array of potential target organisms or may function for boiling bombardment or as surfactants. We are interested both in the development of these glands as well as their biochemical composition and biological function. The red flour beetle also offers a great system to address olfaction from the odour recognition and discrimination at the periphery to the analysis of the plasticity of the central olfactory pathway.
Applied Developmental Biology: Biotechnological improvements on the Sterile Insect Technique (SIT). SIT is a successful genetic pest management strategy to prevent, control, suppress, or even eradicate invasive insect pest species from islands, large agricultural production areas, or even complete continents. SIT is a species-specific and eco-friendly insect birth control measure involving mass production, sterilization, and sustained area-wide release of large quantities of sterilized insects. This leads to unproductive matings, which shrinks the population. Our current biotechnological efforts, which include transposon-based germ line transformation and CRISPR/Cas9-based genome editing improve on transgenic female-specific lethality systems to enable more efficient male-only releases, on reproductive sterility systems to overcome the problem of radiation-reduced fitness, and on transgenic markers to better monitor the efficacy of SIT applications.
